Description

Environment - Windows 10 Pro, Status Desktop App v2.38.1.

Reproducibility - 1/2 (50%).

Overview:

While testing the app's Market tab for the first time, the screen ran into an unexpected `IndexDefect` error, causing a functional crash. Looking into the background desktop logs, the system recorded a couple of backend hiccups at the exact time of the failure, including a data parsing error (`JSON.parse` syntax error) and a network connection issue with the ENS service.

Pre-Conditions:

1. Status Desktop Application is installed and launched.
2. Device has an active internet connection.

Steps to Reproduce:

1. Open the Status Desktop application.
2. Sign up / Login using credentials.
3. Go to the Market tab.
4. Observe the UI response and background logs.

Expected Result: The Market tab should open smoothly and show the token information without throwing any system errors.

Actual Result: The app runs into an `IndexDefect` exception. The logs show that the system had trouble reading the network data format and failed to connect properly to the ENS resolver.

System Logs:

```
19:41:05.602Z  ERR  Error parsing my revealed addresses: SyntaxError:
JSON. parse
19:41:07.171Z  ERR  status-go error [methodName:ens_getName, code:-
32000, message:not a resolver]
19:41:26.417Z  ERR  getChatContentModule: unexisting chat key
19:43:47.995Z  WRN  TypeError: Cannot read property 'chainId' of
undefined
```

Comment by [K Manjunath](#) [29/Jun/26]

Note on Reproducibility: This issue occurred only on the initial launch and did not repeat after clearing the app data. This points to a potential timing issue (race condition) or a temporary hiccup when syncing data from the network for the very first time. The logs below capture the exact moment the system failed.
